Risk of Chronic Kidney Disease Progression and Frequency of Assessment
(according to estimated glomerular filtration rate (eGFR) and albuminuria)

The eGFR and albuminuria grid depicts the risk of progression, morbidity, and mortality by color, from lowest to highest (green, yellow, orange, red, deep red).

The numbers in the boxes are a guide to the frequency of assessment annually.

- Green: annual assessment for those at risk. (Green can reflect CKD with normal eGFR and albumin-to-creatinine ratio (ACR) only in the presence of other markers of kidney damage, such as imaging showing polycystic kidney disease or kidney biopsy abnormalities)
- Yellow suggests assessment at least once per year;
- Orange suggests assessment twice per year;
- Red suggests assessment three times annually;
- Deep red suggests assessment four times annually.

These are general parameters only, based on expert opinion and must take into account underlying comorbid conditions and disease state, as well as the likelihood of impacting a change in management for any individual patient.
